**Inventor:** Paul Harriss

**Publication Number:** US6241136B1

**Product Description:** The purpose of the apparatus and method for carrying a child is to allow a standing individual to carry a standing child. It's as simple as placing the elongated support just above the waist, adjusting it to a comfortable fit, and latching it. By placing the belt-like apparatus above the hips, it prevents downward sliding. The child inserts their feet into the stirrups which extend below the elongated support. This places the child's body behind the standing individual, and arms near the neck for the child to encircle his or her arms around.

## Need Help With A Design or Patent?

CDN can help guide you through the patent process as well as assist with any final design changes before a patent is submitted.
